Population

SUPPLEMENTARY  
REPORTS

January 30, 1963

PC(S1)-41

PLACE OF WORK AND MEANS OF TRANSPORTATION TO WORK: 1960

(The tables presented here are preprints of tables 216, 302, and 303 from Final Report PC(1)-1D, which is scheduled to be published in several months and which will contain additional summary information on the detailed characteristics of the population)

About 83 percent of the workers living in the central cities of standard metropolitan statistical areas (SMSA's) of 100,000 or more at the time of the 1960 Census also worked in these central cities, about 9 percent commuted to the outlying suburban ring, and approximately 2 percent worked outside the area (table 302). Of the workers living in the ring of these SMSA's, about 58 percent worked in the ring, 33 percent in the central cities, and 5 percent worked outside their SMSA of residence.

Although the major part of the working population of central cities of the combined SMSA's work in these cities, there is an appreciable variation from area to area. There was no SMSA in which less than one-half of the resident workers of central cities worked in these cities. There were, for example, 3 SMSA's, Huntsville, Jersey City, and Newark in which this percentage ranged between 50 and 60. At the other extreme, the figure for the Newport News-Hampton SMSA was 93 percent, and there were 7 other SMSA's in which it fell between 90 and 93 percent.

The variability among areas in the percentage of the resident working population of the ring that also worked in the ring was somewhat greater. This percentage ranged from 20 for the Rochester SMSA to 79 for the Trenton SMSA. The high percentages have occurred

either in SMSA's which have considerable industrial development in the ring, such as Trenton or Pittsburgh, or in areas in which the population of the ring was relatively small and essentially rural, such as the El Paso and Lubbock areas.

In the aggregate, the number of workers who were residents of the central city but commuted to the ring was relatively small. There were, however, 7 SMSA's in which the percentage of commuters to the ring ranged from 25 to 40 percent. These areas were by and large relatively small, and with one exception had sizable military installations in the ring. In contrast, there were 8 SMSA's in which the percentage of workers commuting to the ring was less than 3, among them the New York SMSA.

Workers who live in the ring and work in the central city are in a sense the concrete manifestation of the public image of the commuter or suburbanite. In the aggregate they account for about one-third of the working population of the rings of SMSA's, but this proportion is highly variable among individual SMSA's. For 4 areas--Rochester, Winston-Salem, Durham, and Muskegon-Muskegon Heights--it ranged between 65 and 75 percent. At the other extreme there were 3 SMSA's--Jersey City, Paterson-Clifton-Passaic, and Trenton--in which

U.S. DEPARTMENT OF COMMERCE, Luther H. Hodges, Secretary  
BUREAU OF THE CENSUS, Richard M. Scammon, Director

For sale by the Bureau of the Census, Washington 25, D.C., and U.S. Department of  
Commerce Field Offices, 10 cents.

fewer than 10 percent of the workers living in the ring worked in the central city. It will be noted that these 3 SMSA's are adjacent to the very large New York and Philadelphia SMSA's and that, in each case, a larger number of residents of the ring worked outside the smaller SMSA than worked in its central city.

The SMSA's with the highest percentages of commuters from the ring exemplify the situation which is implicit in a great deal of the discussion of suburbanization and commutation. Employment opportunities are concentrated in the central city, a large proportion of the suburban population commutes to work, and the proportion of the workers living in the ring who also work there is relatively small. In contrast, the SMSA's with the smallest proportion of commuters from the ring lie in the heart of the extensive and undifferentiated urbanized areas of the east coast, and in this megalopolitan setting the differentiation between central city and ring loses much of its meaning.

The workers who commute from the ring to the central city were in some respects different from other workers in SMSA's. The percentages of males among the commuters was higher than that for other workers (73 vs. 66 percent) as was the percentage in the age group 25 to 44 years (52 vs. 45 percent). Likewise, the proportion using private automobile or carpool was greater among the commuters (table 216). The percentages of managers, officials, and proprietors; clerical and sales workers; and craftsmen, foremen, and kindred

workers were higher among the persons who commuted to the central city than among all other workers. The percentage of service workers, however, was somewhat lower.

The New York SMSA was the only SMSA in which more than one-half of the workers (about 55 percent) used public transportation in going to work. This percentage ranged between 25 and 44 for the Jersey City, New Orleans, Chicago, Philadelphia, Newark, and Boston SMSA's, and was less than 25 percent for all other SMSA's (table 303). The lowest percentages of workers using public transportation occurred in the smaller SMSA's such as Eugene (1.4 percent) and Bay City (1.2 percent).

All of the statistics in this report were obtained from a 25-percent sample, consisting of one household out of every four (and of one person out of every four persons not in households). There may be differences between comparable distributions in this report and in other reports of the 1960 Census of Population because of sampling variability or errors in processing. Definitions of the terms used in this report, explanations of collection and processing procedures, and a statement on sampling variability may be found in the introduction to any of the reports in the PC(1)-D series.

An outline of the publication program for the 1960 Census of Population may be obtained free of charge from the Bureau of the Census, Washington 25, D.C., or from any U.S. Department of Commerce Field Office.

Table 216.--PLACE OF WORK DURING THE CENSUS WEEK, BY SELECTED CHARACTERISTICS, FOR WORKERS LIVING IN STANDARD METROPOLITAN STATISTICAL AREAS  
OF 100,000 OR MORE: 1960

**FERTILITY OF THE POPULATION: 1960**

(The tables presented here are preprints of tables 190, 192, and 284 (or portions thereof) from Final Report PC(1)-1B, which is scheduled to be published next month and which will contain additional summary information on the detailed characteristics of the population)

Although women 30 to 39 years old had not reached the end of the childbearing period, they had already borne more children (about 2,500 children per 1,000 women) than the women who were 45 to 49 years old (2,245 children per 1,000 women). The average number of children ever born will increase considerably as the women who were 30 to 39 years old in 1960 approach age 45, but the current average is already 17 percent above the lifetime average of about 2,140 children per 1,000 women needed for replacement of the population from generation to generation, given mortality conditions as in 1959.

The experience of the cohort of women who were 50 to 54 years old in 1960 represents a turning point in the trend in completed fertility. They had an average of only 2,176 children ever born per 1,000 women, which is the lowest national average on record for completed fertility. Women at successively older ages in 1960 had successively higher averages because of a previous trend toward smaller families that ended with the women 50 to 54 years old in 1960.

Women 30 to 34 years old in 1960 who had married were young enough to have participated in the postwar pattern of earlier marriage.

They had borne nearly as many children on the average as women 35 to 39 years old. They had a lower percent of childlessness (10.4 percent for women age 30 to 34 as compared with 11.1 percent for women age 35 to 39) and a lower percent who had borne only one child (14.7 percent and 15.1 percent, respectively).

Changes over the decade in the distribution of women by specific numbers of children ever born can be studied by comparing 1960 Census data for the conterminous United States with corresponding data for the same age group in the 1950 Census. For example, comparisons of data for women 30 to 34 years old in the two censuses reveal that increases in fertility among women of this age have involved increases in the proportion with three, four, five and six, and seven or more children, and reductions in the proportion with fewer than three children. Thus, the higher orders of births were involved in the changes for this age group. The pattern of change is only in part explained by the fact that the women 30 to 34 years old in 1960 had married earlier on the average and therefore had more time to bear children than women of this age in 1950. As of 1960, the women 30 to 34 years old already had more children on the average than women 40 to 44 years old, who were the survivors of women 30 to 34.

U.S. DEPARTMENT OF COMMERCE, Luther H. Hodges, Secretary

years old in the 1950 Census. The average woman 30 to 34 years old in 1950 married and began childbearing during the economic depression of the 1930's.

For at least a century, nonwhite women of each age have generally borne more children on the average than white women. The fertility of the population also varies considerably among regions, divisions, and States. In 1960, among women 35 to 44 years old, the average number of children ever born was lowest in the Northeast Region (2,181) and in other regions it ranged from 2,458 to 2,679. By States, the rate for women 35 to 44 years old ranged from 2,079 in New York to 3,338 in Utah. The District of Columbia (with 1,723) had a lower rate than that of any State.

The relatively high birth rates during the five years preceding the census are reflected in 1960 Census data on women by number of own children under 5 years old as compared with data from the 1950 Census and the 1940 Census. Among women under the age of 30 who had married, increases in rates of own children under 5 years old were larger in the period from 1950 to 1960 than in the period from 1940 to 1950, both relatively and absolutely. Among women 35 to 44 years old, however, the corresponding increases were smaller in the 1950's than in the 1940's.

A somewhat different trend is observed in the corresponding data for women of all marital classes, including single women, all of whom were considered childless for the purpose of these tabulations. At each age group these rates showed smaller relative increases for the period 1950 to 1960 than for the period 1940 to 1950. This situation is explained by the fact that the earlier period was affected by a trend toward relatively more married women in each age group as well as by changes in fertility of the women who had married. By 1950 this trend toward higher proportions married had largely run its course; thereafter, increases in the fertility of women of all marital classes depended mainly on changes in

the fertility of the women who had married and relatively little on further reductions in the proportion of women of each age who were single.

The 19.6 million own children under 5 years old of ever-married women 15 to 49 years old comprised 96.5 percent of the total child population under 5 years old in 1960. Most of the difference between the number of own children and the population under 5 years old probably reflects children not living with their mothers.

The proportion of children under 5 years old who are not classified as own children was much larger for nonwhites (14.8 percent) than for whites (1.6 percent). A relatively larger proportion of young nonwhite children are known, from statistics on relationship, to be grandchildren of the household head. Evidently in numerous instances the grandparents take care of the child while the mother works and lives elsewhere.

All of the statistics for 1960 in this report were obtained from a 25-percent sample, consisting of one household out of every four (and of one person out of every four persons not in households). There may be differences between comparable distributions in this report and in other reports of the 1960 Census of Population because of sampling variability or errors in processing. Definitions of the terms used in this report, explanations of collection and processing procedures, and a statement on the sampling variability may be found in the introduction to any of the reports in the PC(1)-D series.

Statistics similar to those shown for the United States in this report are shown occasionally in Current Population Reports, Series P-20, based on data collected by the Bureau of the Census in the Current Population Survey.

An outline of the publication program for the 1960 Census of Population may be obtained free of charge from the Bureau of the Census, Washington 25, D.C., or any U.S. Department of Commerce Field Office.

Table 190.--CHILDREN EVER BORN, BY AGE, COLOR, AND MARITAL STATUS OF WOMAN, FOR THE UNITED STATES: 1960  
(Percent not shown where less than 0.1)

LOW INCOME FAMILIES: 1960

This report presents statistics on income in 1959 of families and unrelated individuals with selected characteristics as enumerated in the Eighteenth Decennial Census of Population. The statistics in this report are in the form of two major tables--Table 1, All families and those with incomes under \$3,000 in 1959, by age, color and sex of head; and Table 2, All unrelated individuals and those with incomes under \$1,500 in 1959, by age and color, which provide data by States for families and unrelated individuals--and a series of text tables<sup>1</sup> which summarize State data and facilitate comparisons among States and comparisons of individual States or regions with the United States.

For the country as a whole, the median family income rose substantially from 1949 to 1959. The 1959 median family income of \$5,700 was \$2,600, or 84 percent, above its 1949 level.<sup>2</sup> Table A indicates that the change in median family income was relatively greater in States having lower median family incomes in

1949. Of the six States with median family incomes below \$2,000 in 1949, four had increases of over 100 percent; the other two showed increases of 99 percent. All States with a median family income above \$2,000 in 1949 had an increase of less than 100 percent. In general, States with the highest median family incomes in 1949 had smaller relative increases. It appears that the States are relatively more similar in terms of family median income in 1959 than they were 10 years earlier.

When one looks at additional statistics for the 9.7 million families whose 1959 incomes were under \$3,000, it is found 2.2 million were white families with an aged male head, 1.4 million were white families with a female head, 1.6 million were white families with a male head under 65 who was unemployed part of the year, and 2.0 million were non-white families. These four groups together accounted for about three-fourths of the low income families in 1959.

Among the four regions, median family income was highest in the West. In 1959, the median income of families in that region was about \$6,300, or about 42 percent higher than the \$4,500 median family income in the South, the region with the lowest median family income. Table B shows that of the ten States comprising the lowest one-fifth of States ranked by size of median family income, nine were in the South.

<sup>1</sup> Text tables C, D, and E, which are drawn from the forthcoming Census Bureau report PC(2)-4C, Sources and Structure of Family Income, were prepared from a tabulation for which financial support was provided by the Welfare Administration, Department of Health, Education, and Welfare.

<sup>2</sup> Using the Consumer Price Index to adjust for price changes reveals that the increase in family real income, as measured by median family income, was about 50 percent. In terms of rates of increase, this would be about 4 percent compounded yearly.

Table B shows the percent families with selected characteristics are of all families. This is shown both for the United States as a whole, and for the 50 individual States and the District of Columbia. The left-hand portion of table B relates the number of families with certain demographic characteristics to the total number of families in the United States (or individual State). The right-hand portion of the table shows the percentage of all families in the State that had both the selected characteristics and an income of under \$3,000 in 1959. Families with these combinations of characteristics are also related to the total number of families in the United States (or individual State). As an example, table B shows that of the 541,000 families in South Carolina, 3 percent had nonwhite male heads 65 years of age or older. The right-hand portion of table B reveals that of the total families about 2 percent are families with incomes of under \$3,000 and had a head with the above characteristics. In using table B it should be kept in mind that all percents have as a base the total number of families in an individual State (or the United States).

Table C illustrates the composition of all United States families and of white and nonwhite families on the basis of selected characteristics. Statistics are presented both in absolute numbers and as percents.

In 1960, families headed by males numbered 41 million, 91 percent of all families. Of these, 36 million were families with the head under 65 years of age. There were 35 million families with both head and wife present, representing 77 percent of all families. By comparing the percent composition of the total number of all families with the percent composition of families with income under \$2,000 (or under \$3,000), it is possible to observe relations among family characteristics and family income. For example, the subgroups of all families referred to above are not proportionally represented in the composition of families having incomes less than \$2,000 on the basis of what would be expected from their relative frequency in the composition of all families. Husband-wife families account for 77 percent of all families but for only 45 percent of all families with incomes under \$2,000 in 1959. Families headed by a woman 65 years of age and over are 2 percent of total number of all families but account for 6 percent of all families with incomes under \$2,000--about two and one-half times their expected fre-

quency. Similar comparisons can be made using white or nonwhite families.

Of both economic and sociological significance are differences in the structural composition of families. In 1960, 8 percent of white families were headed by a female, whereas 21 percent of nonwhite families had female heads. Table C also reveals that 14 percent of white heads of families were 65 and over whereas 12 percent of nonwhite heads were 65 and over.

Of all families in the United States in 1960, 91 percent were white and 9 percent were nonwhite. White families with incomes under \$2,000 accounted for 13 percent of all U.S. families, and nonwhite families with incomes under \$2,000 accounted for 3 percent. Of all families headed by a female, 35 percent had incomes under \$2,000 in 1959; white families with incomes under \$2,000 accounted for 23 percent and nonwhite families with incomes under \$2,000 accounted for the other 12 percent.

Table E indicates that about 19 out of 100 white families had an income under \$3,000 in 1959; about 48 out of 100 nonwhite families had an income under \$3,000. Seventy percent of nonwhite families headed by a male 65 years of age and over, and 75 percent of nonwhite families headed by a female, had incomes under \$3,000.

#### DEFINITIONS AND EXPLANATIONS

Income in 1959.--"Total income" is the sum of amounts reported separately for wage or salary income, self-employment income, and other income. Wage or salary income is defined as the total money earnings received for work performed as an employee. It represents the amount received before deductions for personal income taxes, Social Security, bond purchases, union dues, etc. Self-employment income is defined as net money income (gross receipts minus operating expenses) from a business, farm, or professional enterprise in which the person was engaged on his own account. Other income includes money income received from such sources as net rents, interest, dividends, Social Security benefits, pensions, veterans' payments, unemployment insurance, and public assistance or other governmental payments, and periodic receipts from insurance policies or annuities. Not included as income are money received from the sale of property (unless the recipient was engaged in the business of selling such property), the value of income "in kind," withdrawals of bank deposits, money

Table B.--SELECTED CHARACTERISTICS OF ALL FAMILIES AND THOSE WITH INCOMES UNDER \$3,000 IN 1959, BY STATES RANKED BY MEDIAN INCOME: 1960  
(Based on 25-percent sample. Percent not shown where less than 0.1. See text for source and availability of data)

borrowed, tax refunds, and gifts and lump-sum inheritances or insurance payments.

In the statistics on family income, the combined incomes of all members of each family are treated as a single amount. Although the time period covered by the income statistics is the calendar year 1959, the composition of families refers to the time of enumeration. For most of the families, however, the income reported was received by persons who were members of the family throughout 1959.

Median income.--The median income is the amount which divided the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median.

Conterminous United States.--The term "United States" refers to the 50 States and the District of Columbia. The term "conterminous United States" refers to the United States exclusive of Alaska and Hawaii.

Farm-nonfarm residence.--The rural population is subdivided into the rural-farm population, which comprises all rural residents living on farms, and the rural-nonfarm population, which comprises the remaining rural population. The nonfarm population, as the term is used in this report, comprises persons living in urban areas and rural persons not on farms. In the 1960 Census, the farm population consists of persons living in rural territory on places of 10 or more acres from which sales of farm products amounted to \$50 or more in 1959 or on places of less than 10 acres from which sales of farm products amounted to \$250 or more in 1959.

Age.--The age classification is based on the age of the person in completed years as of April 1, 1960, as determined from the reply to a question on month and year of birth.

Color.--The term "color" refers to the division of population into two groups, white and nonwhite. The color group designated as "nonwhite" consists of such races as the Negro, American Indian, Japanese, Chinese, Filipino, Korean, Asian Indian, and Malayan races. Persons of Mexican birth or ancestry who are not definitely of Indian or other nonwhite race are classified as white.

A breakdown by color into farm and non-farm categories is provided for the South. Separate data are shown for nonwhite only in those States having a nonwhite population of 25,000 or more.

Family.--A family consists of two or more persons in the same household who are related to each other by blood, marriage, or adoption; all persons living in one household who are related to each other are regarded as one family. A "husband-wife" family is a family in which the head and his wife are enumerated as members of the same household.

Unrelated individual.--An unrelated individual is (1) a member of a household who is living entirely alone or with one or more persons all of whom are not related to him, or (2) a person living in group quarters who is not an inmate of an institution.

Collection and processing of the data.--The statistics in tables 1, 2, and A and B of this report were obtained from a 25-percent sample, consisting of one household out of every four (and of one person out of every four not in households). The statistics in tables C, D, and E were obtained from a 5-percent sample, consisting of one household out of every twenty.

There may be differences between comparable distributions in this report and those in other reports of the 1960 Census of Population because of sampling variability or errors in processing. More detailed definitions of the terms used in this report, explanations of collection and processing procedures, and a statement on the sampling variability may be found in the introduction to the 1960 Census of Population, Volume I, Characteristics of the Population, Part 1, United States Summary, and in each of the State parts.

In the processing of data for the Eighteenth Decennial Census, agricultural workers living in group quarters on farms were incorrectly classified as rural-nonfarm residents in some States. It was feasible to correct this minor error for some States prior to the publication of 1960 Population Census Volume I. For those States for which a correction had not previously been made, a fairly adequate correction was made for purposes of this report by holding the proportionate white-nonwhite distribution constant but adjusting the absolute numbers to agree with the correct total number of rural unrelated individuals. The following States were those for which the adjustment was made: Alaska, Arizona, California, Colorado, Connecticut, Delaware, Hawaii, Idaho, Illinois, Indiana, Iowa, Maine, Maryland, Massachusetts, Michigan, Minnesota, Montana, Nebraska, Nevada, New Jersey, New Mexico, New York, Oregon, Pennsylvania, Utah, Vermont, Washington, Wyoming.

Table 1.—ALL FAMILIES AND THOSE WITH INCOMES UNDER \$3,000 IN 1959, BY AGE, COLOR, AND SEX OF HEAD, FOR THE UNITED STATES, BY REGIONS AND STATES, FARM AND NONFARM: 1960

(Based on 25-percent sample. Percent not shown where base is less than 0.1 or where base is less than 200. See text for source and availability of data)

FAMILY INCOME IN METROPOLITAN AREAS: 1960

About 15 percent of the 28.6 million families living in standard metropolitan statistical areas (SMSA's) in 1960 reported money incomes of less than \$3,000 in 1959.<sup>1</sup> Of all classes of families living in SMSA's in the North and West, about one out of seven reported incomes under \$3,000. In the South the incidence was considerably higher--about one out of five. Nonwhite families with incomes under \$3,000 comprised 39 percent of all nonwhite families in the North and 48 percent in the South.

The percentage of families with incomes under \$3,000 appears to be inversely related to the population size of SMSA's. In those SMSA's with populations of 3 million or more, 13 percent of all families reported incomes under \$3,000; in SMSA's of less than 100,000 population, 21 percent of all families had incomes under \$3,000. The incidence of incomes under \$3,000 for all classes of families varies considerably, however, among the individual SMSA's of 1 million inhabitants or more. The percentage of families with incomes under \$3,000 ranged from 21 percent in the Atlanta,

Ga., SMSA to 8 percent in the Patterson-Clifton-Passaic SMSA. For nonwhite families only, percentages ranged from 49 percent in the Atlanta, Ga., SMSA to 20 percent in the Seattle, Wash., SMSA.

DEFINITIONS AND EXPLANATIONS

Standard metropolitan statistical area.-- Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities, rather than counties.

Color.--The term "color" refers to the division of population into two groups, white and nonwhite. The color group designated as "nonwhite" includes Negroes, American Indians, Japanese, Chinese, Filipinos, Koreans, Hawaiians, Asian Indians, Malayans, Eskimos, Aleuts, etc. Persons of Mexican birth or ancestry who are not definitely of Indian or other nonwhite race are classified as white.

<sup>1</sup> The income levels used in this report do not necessarily reflect levels of well-being. In interpreting these data from that standpoint, one should also consider, among other things, family size, family composition, and local price levels.

Income in 1959.--Information on income for the calendar year 1959 was requested from all persons 14 years old and over in the sample. "Total income" is the sum of amounts reported separately for wage or salary income, self-employment income, and other income. Wage or salary income is defined as the total money earnings received for work performed as an employee. It represents the amount received before deductions for personal income taxes, Social Security, bond purchases, union dues, etc. Self-employment income is defined as net money income (gross receipts minus operating expenses) from a business, farm, or professional enterprise in which the person was engaged on his own account. Other income includes money income received from such sources as net rents, interest, dividends, Social Security benefits, pensions, veterans' payments, unemployment insurance, and public assistance or other governmental payments, and periodic receipts from insurance policies or annuities. Not included as income are money received from the sale of property (unless the recipient was engaged in the business of selling such property), the value of income "in kind," with-

drawals of bank deposits, money borrowed, tax refunds, and gifts and lump-sum inheritances or insurance payments.

In the statistics on family income, the combined incomes of all members of each family are treated as a single amount. Families with negative incomes (losses), as well as those with zero and positive incomes are included in the tabulations of this report. Although the time period covered by the income statistics is the calendar year 1959, the composition of families refers to the time of enumeration. For most of the families, however, the income reported was received by persons who were members of the family throughout 1959. The percentages shown in this report were computed using numbers prior to rounding.

More extensive definitions of the terms used in this report, explanations of collection and processing procedures, and a statement on sampling variability, may be found in the introduction to 1960 Census of Population, PC(3)-1D, Standard Metropolitan Statistical Areas, from which publication the data presented here are drawn.

INCOME IN 1959 OF FAMILIES, BY COLOR OF HEAD, FOR STANDARD METROPOLITAN STATISTICAL AREAS, BY RESIDENCE INSIDE AND OUTSIDE  
CENTRAL CITY (OR CITIES): 1960

(Numbers in thousands. See text for explanations. Data for individual standard metropolitan statistical areas shown only for those with 1,000,000 inhabitants or more. Percent not shown where less than 0.1 or where base is less than 400)

SUPPLEMENTARY  
REPORTS

March 31, 1964

PC(S1)-45

SIZE OF FAMILY INCOME, BY FAMILY CHARACTERISTICS: 1960

(This is an advance report of the data which will be presented in Final Report PC(2)-40)

This report presents statistics from the 1960 Census of Population on income by selected social and economic characteristics of the families of the United States. The data presented here are being issued in advance of their publication in the report PC(2)-4C, Sources and Structure of Family Income, which will provide additional information on the same subject. The final report will be published in the near future. The statistics in this advance report are presented in the form of a preprint of a portion of table 1 from the final report and a series of summary tables. Throughout this report families are classified by their characteristics in 1960 except that income figures refer to their 1959 incomes.

Of the 45.1 million families in the United States in 1960, 9.7 million, or 21 percent, received total money incomes of less than \$3,000 in 1959. About 54 percent received incomes of less than \$6,000. On the other hand, 2.1 million families, or 5 percent, received incomes of \$15,000 or more.

Families not headed by a married couple ("other male head" and "female head" as opposed to "husband-wife" families) are relatively more numerous at the lower income intervals. Families with a female head accounted for 2.1 million, about 22 percent, of the 9.7 million families with incomes of less than \$3,000.

Of the 6.8 million families with incomes of \$10,000 or more, those with female heads numbered 246,000, only 4 percent of the total. The heavy incidence of low family incomes among families with nonwhite female heads can be seen in table A. Of the 890,000 families with nonwhite female heads, 651,000, or 73 percent, received incomes under \$3,000; but only 14,000, or about 2 percent, received incomes of \$10,000 or more in 1959. Although families with a white female head were not concentrated as far down the income scale as those headed by a nonwhite female, 43 percent received incomes of less than \$3,000, and only 7 percent received incomes of \$10,000 or more.

Cross-classifying the age and education of heads of husband-wife families in 1960 with their 1959 family incomes reveals a similar relationship between age and median family income regardless of the number of years of school completed (table B). For each education class, median family income increases from the age group under 25 to the age group 25 to 64 years old and then decreases for the age group 65 years old and over. For families headed by college graduates, however, the initial increase with age is relatively much greater, and the subsequent decrease relatively less, than it is for families whose heads have completed fewer years of school. As a result

U.S. DEPARTMENT OF COMMERCE, Luther H. Hodges, *Secretary*

Washington, D.C., 20402, 10 cents.

the relative difference in median income between families whose head received little schooling and those headed by a college graduate increases with the age of the head. The group of husband-wife families headed by a college graduate under 25 years of age had a median income 60 percent higher

than the group whose head was in the same age class but had completed only 8 years or less of elementary school; for family heads 25 to 64 years old, the median income was 88 percent higher; and for those 65 and over, the median was 176 percent higher.

Family incomes were lower in the South than in any of the other regions (table C). Twenty-one percent of the families in the South received incomes under \$2,000. In the Northeast, only 8 percent of the families received incomes under \$2,000.

## LIBRARY

The number of earners in a family is an important factor in explaining the size of family incomes. Of the 21.8 million families having only one earner, 22 percent had incomes below \$3,000 in 1959. On the other hand, only 10 percent of the 19.8 million families with more than one earner had incomes below \$3,000 (table D).

All of the statistics in this report were obtained from a 5-percent sample, consisting of one household out of every twenty. Total income is defined as the sum of money wage or salary income, net income from self-employment, and income other than earnings, such as net rents, interest, dividends, Social Security benefits, pensions, and public assistance or other governmental payments. Family income is the combined total received from these sources by all family members during the calendar year 1959. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median, and the other having incomes below the median. More complete definitions of the terms used in this report, explanations of collection and processing procedures,

and a statement on sampling variability may be found in 1960 Census of Population, Final Report PC(2)-4C, Sources and Structure of Family Income.

**SUBJECT GUIDE TO 1960 CENSUS DATA FOR THE NEGRO POPULATION**

The Bureau of the Census has published data on the Negro population in many of the reports of the 1960 Census. The guide presented here shows, in one place, the types of data available for the Negro population, the geographic detail for which they are presented, and the specific report in which they have been published. In addition, data on the total nonwhite population are shown in most of the 1960 Census reports for a wide range of areas, including census tracts and city blocks. The material in the guide is confined to published data from the 1960 Census of Population; but information on unpublished data, data available from current surveys, or population estimates may be obtained by writing to the Chief, Population Division, Bureau of the Census, Washington, D.C., 20233.

Definitions of terms used in this guide can be found in U.S. Census of Population: 1960, Volume I, Characteristics of the Population, Part 1, United States Summary. Complete citations for the reports referred to in the guide are listed in the "Key to Sources." These reports can usually be found in public or university libraries or may be purchased from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., 20402.

**KEY TO SOURCES**

Each source reference is shown in two parts, first the particular report and second, following the dash, the table number. Thus,

for example, the source "II, 4A-1" means table 1 of Volume II, Part 4A, Families (Series PC(2)-4A). The report designations are as follows:

I, US: Part 1, United States Summary, 1960 Census of Population, Volume I, Characteristics of the Population.

I, St: Parts 2 to 52, the individual State parts of 1960 Census of Population, Volume I, Characteristics of the Population.

II, Individual reports of the 1960 Census of Population, Volume II, Subject Reports (also identified as Series PC(2) reports), specifically--

**AGE OF THE FOREIGN STOCK BY COUNTRY OF ORIGIN: 1960**

(The table presented here is a preprint of table 9 from Final Report PC(2)-1A, which is scheduled to be published in several months and which will contain additional information on the detailed characteristics of the foreign stock)

In 1960 almost one out of every five persons in the United States was of foreign stock, that is, either foreign born or native with one or both parents foreign born. Of the 34 million persons of foreign stock, approximately 10 million were foreign born and the remaining

24 million were natives whose mother or father or both were foreign born.

The high average age of both the foreign-born population and the native population of foreign or mixed parentage reflects the decline in immigration over the past four

**Figure 1.—MEDIAN AGE OF THE WHITE POPULATION, BY NATIVITY AND PARENTAGE, FOR CONTERMINOUS UNITED STATES:  
1900 TO 1960**

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary  
BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C. 20233, and U.S. Department of Commerce Field Offices, 10 cents.

decades. The median age of the foreign-born population was 57 years, about 14 years higher than the median age (43 years) of natives of foreign parentage and 33 years above the median age of natives of native parentage (24 years).

The youngest nationality group, in terms of median age, was made up of persons of Mexican origin. Here, immigration not subject to quota restrictions has resulted in a continuous replenishment of the population in the younger ages. Over half of the population born in Mexico was under 45 years of age in contrast with less than a third of that of the entire foreign-born population in the United States.

A very large proportion of persons of foreign stock were living in metropolitan areas in 1960. Almost four-fifths of all persons born in a foreign country or of foreign parents were reported as living in a standard metropolitan statistical area (SMSA) in 1960, as compared with less than two-thirds of the total population. Among persons of foreign stock, the foreign-born group was more "metropolitan" than the native of foreign parentage; 84 percent of the foreign-born persons but only 77 percent of the native persons of foreign or mixed parentage were living in SMSA's.

Major concentrations of many of the nationality groups in the country were living in the Northeast. For example, almost 70 percent of all persons of Italian origin (foreign stock) were living there in 1960; 67 percent of persons of Irish origin; 57 percent of persons with origin in the U.S.S.R.; 54 percent of Polish origin; and 47 and 31 percent of Canadian and German origins, respectively. The population of the South and the West, which together accounted for less than 30 percent of all persons of foreign stock, included almost all the persons of Mexican origin in the United States. About 40 percent of the population of Mexican birth or parentage lived in the South and over half of the group lived in the West.

All of the statistics for 1960 in this report were obtained from a 25-percent sample, consisting of one household out of every four

(and of one person out of every four persons not in households). Definitions of the terms used in this report, explanations of collection and processing procedures, and a statement on sampling variability may be found in 1960 Census of Population, Final Report PC(2)-1A, Nativity and Parentage.
